2: Scheduled Tasks . adobe.cs6.all.products.activator.(x32.y.x64)_up01-MPT.exe Q: Adjusting the font size of a multitable cell in C# I am working on an application where I want to display the output of a batch file in a textbox in a multitable cell. The output in the textbox should be the same in all the rows. I am using C#.Net 4.0. Tabs of output What I have done so far In the design section of the form, I have multitable cell called "Output" which contains a label called "OutputText" and in the column group of that, I've added a textbox called "TextBox1" The code I am using to display the output in the textbox in the multitable cell in the code behind is as follows string output = File.ReadAllText(logFile); OutputText.Text = output; What I want to do now I want to display the same output in textbox1 for all the rows. The reason is that the output varies for each run of the application and in the multitable cell, the first row will always get changed. For ex: the result of dir will be displayed in the textbox. How do I change this to display the same result for all the rows? A: in Design section add a new column in your multitable cell and remove that label textbox, after that set your new column text as label in that column and use this code string output = File.ReadAllText(logFile); OutputText.Text = output; see this doc for more Strong winds are whipping up extensive sand storms across the central Australia desert, a phenomenon that brought a woman's final words in life to light. For 29 years, Mildred Betty Roach could have told of her love story in her own words and been laid to rest — just like she would have wanted. Instead, the 83-year-old died in hospital, without the comfort of a loved one around her to say their final farewell. A death certificate written by a doctor at the Goldfields Hospital in Broken Hill said her death was due to "acute bronchopneumonia". "It took them a while f678ea9f9e
